

Factory Extension, South Petherton - Probiotics International

The Company is a world leading manufacturer and supplier of probiotics to the Health Care, Veterinary, Equine and Agricultural markets. Operating from a state of the art purpose built facility, they appointed Pollard to undertake an extension to the existing plant.

The development comprised the construction of a new manufacturing plant extension with a steel frame structure, internal alterations, M&E installations throughout and associated external works and drainage.

Internally there were a number of complex issues to address, specifically in relation to hygienic areas given the nature of use of the building to produce agricultural food items. Internal partitions required hygienic panels, as did floors and ceilings, matching those within the existing building.

Careful planning was required to ensure minimum disruption to the existing facility.

A fast track three month development, the project was handed over one week ahead of the contract programme.
